

Website Prototype Review

TAHIRELSHAZLI.COM PLATFORM

Date: Thursday, 6 August 2026
Meeting Type: Reviewing Website Prototype
Prepared by: Ali Esam

Overview

In this session, the full dynamic website prototype for Mr. Tahir Elshazli's learning management system was presented to Mr. Tahir Elshazli. The prototype demonstrates the future education platform and the main experiences for parents, students, teaching assistants, teachers, and visitors.

Mr. Abdelrahman-Suggested Changes

Mr. Abdelrahman suggested the following changes:

1. Certificate Availability

Certificates should be issued at the end of a course. Mr. Tahir Elshazli, as the teacher, should control when the certificate becomes available for the student.

2. Payment Gateways

Begin the payment gateway implementation and add the selected payment flows to the website.

Mr. Tahir-Suggested Changes

Mr. Tahir Elshazli suggested the following product and learning-experience updates:

1. Course Progress and Student Performance

In My Courses, show the student's course completion checkpoints separately from performance. For a student taking recorded classes, progress should represent how much of the course has been completed, such as the number of recorded videos watched or checkpoints completed. Performance should represent grades and achievement, not course completion.

2. Different Student Learning Modes

Support two student modes. Students subscribed to recorded classes need course-completion progress and checkpoints. Students participating through recorded or scheduled sessions need a timeline that reflects attendance, alongside their grades and other performance information.

Mr. Tahir-Suggested Changes (continued)

3. In-Platform PDF Assignment Correction

When a student submits an assignment as a PDF, the teacher should be able to open and correct it directly in the platform. The teacher can mark incorrect words or sections and add edits without downloading the file. After saving, the corrected PDF should be automatically attached to the student's submission for review.

4. Overall Grades for Assignments and Quizzes

For every assignment and quiz, display the overall average grade across all students. This allows the teacher to understand whether a task is difficult or easy and to identify trends in student performance.

5. Report Generation

The teacher and the teaching assistant should be able to generate grades for students, as referenced by Mr. Tahir Elshazli.

6. Flexible File Uploads

Students should be able to submit assignments using the file types appropriate for the task. Teachers should also be able to upload the materials they need for quizzes, assignments, and lessons, including PDFs, text files, links, and other supported formats.

Summary

The requested updates focus on making learning progress clearer, separating completion from performance and attendance, reducing manual file handling, and giving the teaching team better visibility into student outcomes. These changes should be incorporated into the dynamic website experience as the prototype moves toward implementation.
